Hi there Awesome Wordpress Developer,

Thanks for taking the time to complete this technical exercise for us. We use these tasks to get a feel for your preferred coding style, to test your knowledge of the platform and understand what you regard as 'production ready' code.

If any of the requirements are unclear, feel free to make sensible assumptions and just let us know when submitting the final solution.

Once again, thanks for your time and good luck!

Task

Our Domain tech blog (tech.domain.com.au) is hosted on a WordPress instance. I would like you to write a plugin I can install in my WP instance that will render a single property snapshot into a blog post.

You should load the property details from our API:
http://rest.domain.com.au/propertydetailsservice.svc/propertydetail/2012422241

You should render it as per the "Listing" template on the style guide:
http://style.domain.com.au/web/components/cards.html

The entire cell should link through to the corresponding property on Domain (in this case
https://domain.com.au/2012422241)

Ideally the ID of the property (2011748913 in this case) can be entered by the WP author when inserting the widget in a post or page.

Deliverable

I would like you to write a plugin I can install in my WP instance that will create a widget to render a single property snapshot into a blog post.
